

COMPUTER UPDATE NOTICE

SUBJECT: IQ-950 ZEN AIR WATCH UPDATE

FIRMWARE UPDATE RELEASE DETAILS

For IQ-950 ZEN AIR Dive Computers to version 1B

EXPLANATION

In response to input received from owners and users of the IQ-950 ZEN AIR, TUSA has corrected or modified the following items to improve the IQ-950 ZEN AIR's operation:

- Added EEPROM (memory) protection in the operating code to prevent data stored in the viewable Log from changing. This occurred after conducting NORM dives when data was first displayed in the Log as No Deco then upon access later it was displayed as being Deco and GAUG.
- Changed the No Deco Safety Stop Depth from 4.5M to 5M (metric units). This was requested to be in agreement with local training guidelines.

UPDATE PROCESS

Units affected are the IQ-950 ZEN AIR model containing earlier versions of firmware.

In the event that you have experienced any of the above, or you want to be sure they don't occur, you can update your IQ-950 ZEN AIR's firmware (operating software program) to newly released revision 1B using the IQ-950 ZEN AIR Firmware Update program (version 2.0.0). The IQ-900-030 ZEN Series USB cable is required. There is no need to return the unit to TUSA.

***The update program with download instructions is available at www.tusa.com under the Support Section
Or directly at this [link](#) (.zip file, 17.7MB)***

Should you have any questions, please contact your Authorized TUSA Dealer, or TUSA Customer Service by calling 800-482-2282 (8AM -5PM, PST Monday - Friday) or send an email to info@tusa.com.
